                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       유
                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening drug candidates; (ii) for screening of bioactive agent capable of bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (iv) for accinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma are appensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent
                                                                                                                                                                                                                                                                                                        Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 177587 BP; 49045 A; 38259 C; 39386 G; 50877 T; 0 U; 20 Other;

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORF8) of the genome of Chlamydia trachomatis (see AAZ01425). These ORF9 encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and tibozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; gental diseases such as nongonococcal urstritis, epidymitis, cervicitis, alpingitis, perimpgatitis, bartholinitis; peneumopathy in breast feeding infantes, and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
paratrachoma, inclusion conjunctivitis, genital disesse, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Phage diaplay; bacteriophage M13; fusion protein; major coat protein; protein VIII; phagemid vector; electroporation; combinatorial library;

The invention relates to novel fusion proteins comprising a heterologous polypeptide fused to a variant (non-wild type) bacteriophage major coat protein (protein VIII). The invention also relates to replicable expression vectors which contain a gene encoding the fusion protein; host cells containing the expression vectors; phages which display the fusion proteins on viral surfaces; and methods of using these compositions. The fusion proteins the invention are well tolerated in phage display systems. Variants of the major coat proteins can be used to alter the number of fusion proteins incorporated into a virus particle. Wyper-functional variants can be used to increase the number of fusion proteins incorporated into a virus particle. Wyper-functional variants can be used to increase the number of fusion proteins incorporated into a virus particle. Conversely, hypo-functional variants can be used to increase the number of fusion protein incorporation. This is useful for talloring the incorporation of fusion protein incorporation of particles to achieve a desired level of valency. The variant replicable contracted with a unit mass of DNA. The present invention uses affinity DNA purification to reduce ionic impurities and thus reduce the conductance associated with a unit mass of DNA. This is an advantageous in collection methods for increasing the concentration of DNA present. The increase in DNA entering the host cell provides a greater number of transformants per alectroporation and allows one to prepare larger combinatorial libraries which overcomes the prior art problem of small contraction of the invention for phagemid
                                                                                                                                                                                                                                                                                                                                            Pusion proteins comprising a heterologous protein and a viral variant major coat protein useful in phage display systems for improving transformation efficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 9; Page 68; 118pp; English.

US-09-949-016-169481

Sequence 169481, Application US/09949016

Patent No. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION NUMBER: US/09/949,016

CURRENT APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-00

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SSOFTMARE: FaetSEQ for Windows Version 4.0

LENGTH: 601
                                                                                                                                                                                                                                                                                                                             601

Sequence 1081, Application US/09976594

GENERAL INCORMATION:

APPLICANT: Buchbinder, Jenny

TITLE OF INVENTION: GENES EXPRESSED IN C3A LIVER CELL CULTURES TREATED WITH STEROIDS

FILE REPERENCE: PA-0041 US

CURRENT FILING DATE: 2001-10-12

PRIOR FILING DATE: 2000-110-12

PRIOR FILING DATE: 2000-112

NUMBER OF SEQ ID NOS: 1143

SOFTWARE: PERL PROGRAM

SEQ ID NO 1081

LENGTH: 431
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APPLICANT: Bell, Graeme I.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

The sequence identifier uses the '.80' suffix because the library tag was at the 3 prime end and thus not identified. Samples were collected in Robert E. Sharp's lab (University of Missouri-Columbia) to construct three normalized CDNA libraries. Dark-grown maize seedlings with primary roots or low water potential (-1.6 MPs) vermiculite, and harvested at 5 h and 48 h after transplanting. About 1,000 roots were used for each of the low water potential libraries (zmrws05 and zmrws48) while 500 roots were combined from each of the two time points at high water potential (zmrws00). Each root was divided into 4 segments (distances are from the junction of the root apex and root cap): segment 1, 0-3 mm plus the root cap; man, for a segment 2, 3-7 mm; segment 4, 12-20 mm. (For destails of conditions see (1) with nutrient mail for a set of the conditions see (1) with nutrient mail for a segment 2, 3-7 mm; segment 4, 12-20 mm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modifications as in (2)). The three normalized cDNA libraries were constructed in the lab of Hans Bohnert (University of Illinois-UC). Total RNA was extracted by the 'hot Phenol' method (Plant Molecular Biology manual. D5: 1-13, 2nd ed., 1997). This method worked in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Contact: Hans Bohnert

eliminating carbohydrate material present in the root tips. The integrity of the RNA was verified by denaturing agarose gals and spectrophotometry (ratio A260/280). Poly(A) +mRNA was isolated twice from total RNA using the Oligotex Direct mRNA kit (Qiagen). Poly(A) + mRNA was converted to double-stranded cunA and tagged by using modified Oligo(GT) primers. One of 4 sequence tags corresponding to a different segment of the root was added to the 3'-end of the modified Oligo(GT) primers. One of 4 sequence tags a Not1 site and used to reverse transcribe the segment-specific mRNAs into cDNAs. Each library contains all four tags. A suffix of $1, 82, $3, or $4$) has been added to each sequence identifier to designate which region of the root (Root segment, 2, 3, or $4$) has been added to each sequence identifier to designate which region of the root (Root segment, 2, 3, or $4$) has been added to each sequence lidentifier to designate which region of the root (Root segment, 2, 3, or $4$) has been added to each sequence segment, ould not be identified. The double stranded cDNAs were size-selected (>450 Dp). Size selected cDNAs were adaptored with BcoRl adaptors at both ends, and then digested with Not1. The cDNA was selected cDNAs were adaptored with BcoRl adaptors at both ends, and the orients armyofs; 3.37 x 106; zmrww00: 3 x 106. The background of empty clones was less than 1%. Inserts ranged from -0.5kb to >2.5 kb, as determined by PCR. Plasmid to MAs. from the primary libraries then was converted to single-stranded cDNA population cloned in each library, were used as a driver for normalization. Hybridization between the primary for normalization. Hybridization between the single-stranded library and the PCR products was cancertained by PCR of the entire Potential II outle-stranded and electroporated into the Naize Plimary Root at Low Water Potential II outle 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         at low water potentials by restricting ethylene

/note="Vector: pBRcDNASfiAB; The library was constructed
from 11 different sources of RNA from a single genotype.
Separate cDNAs were generated using primers that
incorporated unique 5' and 3' tags to distinguish each
source of RNA. cDNAs were then pooled, size-fractionated,
directionally cloned into a custom medium-copy vector and
transformations made with four size classes to minimize
size bias. Details of each source of RNA and library
construction can be obtained at http://cgpdb.ucdavis.edu/

Based upon one or more reads of this clone where vector sequence
was present at both ends, this clone has been determined to contain
contain a cDNA insert on the order of 600-1000 bases.
High quality sequence stop: 339.
Liocation/Qualifiers

PolyA mRNA was purified from each sample, pooled and CDNA synthesized. The CDNA was directionally cloned into lambda ZAP II (Stratagene) in the ECORI (5') and XhoI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phase. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Clones are derived from the mouse BAC library RPCI-24. For BAC
library availability, please contact Pieter de Jong

(pdejong@mail.cho.org). Clones may be purchased from BACPAC
Resources (http://www.chori.org/bacpac/orderingframe.htm). BAC end
page: http://www.tigr.org/tdb/bac_ends/mouse/bac_end_intro.html
Plate: 102 row: C column: 4
Seq primer: SP6
Class: BAC ends.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

                                                                                                                            The sequences AA27937-T27989 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-f); 5 and 6a. They esp. from the novel subtypes la-c, 2a-d, 3a-f, 4a-f); 5 and 6a. They esp. from the novel subtypes la-c, 2a-d, 3a-f, 4a-f); 5 and 6a. They esp. from the novel subtypes la-f, 2e-i, 2k, 2l, 3g, 2l, 3g, 2l, 7a-c or types 9. 10 or 11. The sequences corresp. to the 5'.

This sequence represents nucleotides 478-925 from the HCV type loans isolate NB98. The new HCV types were isolated from patients with chronic HCV from the Benalux countries, France, Cameroon and Vietnam, because of their aberrant reactivities. The RNA was extracted, cDNA synthesised and PCR amplified, cloned and genotyped. The 5'W. Core/R1 and NS5B regions were sequenced either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences were used to generate the peptides ARP96424-R96524. The sequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeblides can be used to detect anticy. HCV antibodies, for HCV typing or to prevent HCV infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                            Hepatitis C virus poly:nucleic acid unique to unidentified sub:type used to develop probes and primers for new sub:types and vaccines to prevent and treat infection.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer; cytostatic; carcinogen; pharmacodyanamic marker; marker; gene; ss.
                                                  Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 446 BP; 87 A; 86 C; 81 G; 192 T; 0 U; 0 Other;

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, prostate cancer, cytostatic; carcinogen, pharmacodyanamic marker; pharmacogenomic marker, gene, ss.
   detecting presence of prostate cancer, stage of prostate cancer

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

Schlegel R, Endege WO, Monahan JE;

WPI; 2001-662795/76

Claim 1; Page 7379; 11750pp; English

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specificaction or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastrasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

promoter functional in a plant call, where the promoter is positioned to provide for expression of a polymoclectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising at inspected producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant the card property comprises transformed plant with the amaize or soybean. The method of producing a plant with the conditional DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. CC The recombinant DNA construct is useful for producing plants with construct is useful for producing plants with the polymucleotide or polypeptide is useful for improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth requisors, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomanan condition, improved lignin production or improved date from the scope of the invention. Note: The sequence cate and condition or this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence representes. invention relates to a recombinant DNA construct comprising \$

New recombinant nucleic acid molecules and polypeptides from Gossypium hirsutum, useful for producing plants with improved biological characteristics (e.g. improved plant cold or drought tolerance).

Claim 1; SEQ ID NO 190; 14pp; English

The invention relates to a recombinant polynucleotide comprising any of the 58798 Cotton plant cDNA sequences mentioned in the specification.

Chas a recombinant polypeptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant having an improved property.

Comprises transforming a plant having an improved property comprises transforming a plant having an improved property.

Comprises transforming a plant having an improved property comprising a coding sequence for a polypeptide associated with the property, and growing the transformed plant. The polypeptide is useful for improving plant cold tolerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant cold tolerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant tolerance, producing galactomannan (or lighin or plant growth rates), improving plant tolerance to plant disease, increasing the rate of homologous recombination in plants, improving plant tolerance to extreme osmortic conditions or to pathogens or peets, improving plant by modification of photosynthesis, modification of earbohydrate, nitrogen or phosphorus use and/or uptake, or improving yield by providing improved content, improving yield by modification of earbohydrate, nitrogen continues use and/or uptake, or improving yield by providing improved plant growth and development under at least one stress condition. The polynucleotide and polypeptide may also be used in recombinant DNA contructs, in physical arrays of molecules, as plant breeding markers, or in computer-based storage and analysis systems. The present sequence is a Cotton plant of form part of the printed specification, but was obtained in electronic format directly from Uspryo at conditions. NOTE: The sequence conditions and allosingle, the remaining 52213

Aspergillus fumigatus

WO200286090-A2

```
The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant procein for characterisation, screening or corganisms invade or reside, for comparing with the DNA sequence of A. tharapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. thangatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify opterntial orthologous essential or virulence genes, for scalecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an caringen to raise anti-DNA antibodies or to elicit another immune correlative are or identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to for solution of another insuence or virulence organism. This polynucleotide sequence represents
                                                                                                                                                                                                                                                                                                                                                                                              , purified or isolated nucleic acids of essential genes of Aspergillus nigatus, useful for treating or preventing infections by A. fumigatus, for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                 Lemieux SM;

New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.

Disclosure; Page; 175pp; English.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a bofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic corganisms invade or reside, for comparing with the DNA sequence of the corpusion or dentify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polynucleotides encoding the other protein antigen to raise anti-DNA antibodies or to elicit another immune contains the pathogen and course or to identify inhibitors of the pathogen and t interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This polynucleotide sequence represents one of the essential genes of Aspergillus funigatus of the invention

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic cryanism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic corganisms invade or reside, for comparing with the DNA sequence of their patholicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to select orrelative receptors or ligands in the case or virulence the protein function. The polypeptide sequence represents one of the essential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                           Fungicide, cytostatic, essential gene, Aspergillus fumigatus, infection, cancer, contamination, biofilm, antibody; immune response; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lemieux SM;

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to prevent or contain contamination of an object corganism such as A. fumigatus, or to prevent or inhibit formation on a surface of a bidilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or carpitalm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or carpitalm invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and sequences for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune contexponse, and for identifying polymucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding curs or to identify inhibitors of the binding curs or the protein n assays designed to quantitarively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                     Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lemieux SM;

complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phant or the plant compared to a wild-type or reference plant, or the plant compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having sectence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising in the specification. The isolated or secombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that cencodes a polypeptide or an antisense nucleic acid, inserting the cencodes a polypeptide or antisense nucleic acid into an expression vector. The oa plant or a cell of a plant to overexpress throughout open antisense nucleic acid into an expression of plant, and selecting for a modified trait (e.g. increased production of the polypeptide or antiense nucleic acid, thereby producing a modified comprishing or increased production of the polypeptide resistance, seed and fruit yield, growth rate, leaf and flant commental streas response (e.g. drought), microbial disease

Broun PE;
The invention relates to a transgenic plant having recombinant polynucleotide (II) encoding polypeptide comprising at least 6 consecutive amino acida of a sequence chosen from the protein sequence consecutive amino acida of a sequence chosen from the protein sequence consecutive amino acida of a sequence chosen from the protein sequence comparation of another plant lacking recombinant polynucleotide alters a trait of the seed transgenic plant where proteins are transcription factor-like proteins. Also included are altering (MI) a trait associated with seed (comprising: transforming a plant with [II]; selecting the transformed plants; and identifying a transformed plant with seed having altered trait, altering (M2) the expression levels of at least one gene of a plant (involving transforming the plant with a recombinant polynucleotide comprising: transforming the plant with a recombinant polynucleotide comprising a nucleotide sequence comprising least Is consecutive mucleotides of a caquence appearing as ADC46750 - ADC46766 and selecting the transformed plant, construction and atabase sequence or the database sequence with a plant's trait (involving providing a database sequence in the plant) and altering a plant's trait (involving a database conspraing the test polynucleotide detailed above, selecting a database sequence in the plant) and altering a plant's trait (involving providing a test polynucleotide detailed above at low stringency and transforming the plant, The method (M1) is useful for altering a trait associated with a seed. The method (M2) is useful for altering a plant trait associated with seed. The method (M2) is useful for altering a plant a trait of the least one gene of a plant's seed. The method (M3) is useful for altering a plant are plant and a plant and a plant a seed or plant a plant's seed. The method (M4) is useful for altering a plant and a plant a plan
                                                                                                                                                                                                                     Novel transgenic plant having recombinant polynucleotide encoding polypeptide that alters trait of transgenic plant when compared with same trait of another plant lacking recombinant polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    resistance. The present sequence encodes a transcription factor-like protein/seed trait altering protein of the invention.

Disclosure; SEQ ID NO 1077; 454pp; English.

The invention relates to a number of isolated Arabidopsis thaliana CDNA sequences and their encoded proteins which are especially transcription factor related CDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, such as an alteration in a plant growth characteristic, e.g. growth rate, germination rate of seeds, vigor of plants and seedlings, or leaf and flower sensecence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the CDNAs of the invention.

premature senescence; increased necrosis; increase in seedling or plant size; decreased plant size; leaf morphology; seed morphology; seed blochemistry; increase in root anthocyanins; increase in plant anthocyanins, or alteration in light response or shade avoidance. The transgenic plant, polynucleotides and polypeptides are useful in bioinformatic search methods. This sequence encodes a plant transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered trichome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       increased root growth; increased root hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Broun PE;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description

independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) KR vector using the pBluescript II SK construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation. Normalization was applied according to published methods [Bonaldo MN.F. et al. (1996) Genome Research 6(9):791] in order to reduce the abundance of highly expressed transcripts."

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further details.
                                                                                                                                                                                                                                                                                                   AV801673 402 bp mRNA linear EST 29-MAR-2002 AV801673 RAFL9 Arabidopsis thaliana cDNA clone RAFL09-29-C05 3', mRNA sequence.

                              AV820556 RAFLII Arabidopsis thaliana cDNA clone RAFLII-11-A10 3', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                           An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further details.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BP597828

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAQ83870 encodes AAR69659 hepatitis C virus (HCV) envelope 1 (E1) protein isolate T2, both can be used for the diagnosis of HCV infection, and in the prodn. of anti-HCV vaccines, antibodies and antisera. The cDNA may also be used to inhibit the expression of the HCV E1 gene. (Updated on 25-MAR-2003 to correct PN field.)
                                                    Envelope 1 cDNAs of 51 hepatitis C virus isolates - and derived oligo-
nucleotide(s), peptide(s) and proteins, used in diagnosis and in

                                                                                                                      The sequences AAT27937-T27889 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes ia-c, 2a-d, 3a-f, 4a-f, 5a-f, 5a-f, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5' untranslated region (UR), the Core/E1, NS4 or NS5B regions of the genome. This sequence represents nucleotides 478-25 from the HCV type 10a isolate NB98. The new HCV types were isolated from patients with chronic HCV from the Benelux countries, France, Cameroon and Vietnam, because of their aberrant reactivities. The RNA was extracted, cDNA synthesised and PATA part of the sequenced cither directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences can also be used to synthesise probes and primers for the sequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used to detect antii
                              Hepatitis C virus poly:nucleic acid unique to unidentified sub:type used to develop probes and primers for new sub:types and vaccines to prevent and treat infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis C virus; HCV; non-A non-B; envelope 1 gene; isolate T2; diagnosis; vaccines; antibodies; antisera; gene inhibition; ss.

AAT16559-T16609 are cDNAs encoding the El (envelope-1) protein of 51 HCV isolates. The isolated equences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunishing against HCV infection. The proteins any also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.

AAT16559-T16609 are cDNAs encoding the E1 (envelope-1) protein of 51 HCV teloates. The isolated sequences are useful for the prodm. of primers useful for detecting the presence of HCV in a sample, the primers also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunishing against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.

The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, sallva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                   This sequence represents the 5' region of hepatitis C virus RNA. The original sample was obtained from human and chimpanzee plasma. RNA was isolated from several samples and homology compared, and the respective sequence of about 1900 - 2500 nucleotides of the 5' terminus and 1100 nucleotides of the 3' terminus determined. The 5' region (given) contains an ann-coding region of at least 340 nucleotides and a region coding for the structural protein followed by a region coding for protein (none actually detailed on the sequence given in the pecification). When compared with the sequence of HCV disclosed in EP-388232 this sequence showed homology of 72.5%. (Updated on 25-MAR-2003 to correct PN field.)

```
Antigen related to non-A and non-B hepatitis virus - comprises non-translation region comprising 340 - 341 mols. of nucleotides, non-translation region comprising 1885 - 2551 mols. of nucleotides including region 1,149 and, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of NANB hepatitis virus polynucleotide N-2551 which codes for a non-A, non-B (NANB) hepatitis virus gene HC-OM. The colyrgetide it encodes may be used in a system for detecting NANB hepatitis. This method is highly specific and sensitive, and can detect NANB hepatitis virus which could not be detected by conventional methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non A non B hepatitis virus; amplification; HC-J1; HC-J8; plasma; ss.

                                                                                                                                                          RNA was isolated from the plasma of human patients positive for NANBH virus (strain HC-J6) and was subjected to reverse transcription to produce cDNA. The resulting cDNA was amplified by PCR, and nucleic acid sequences determined by analysis of both clones from the cDNA library and clones obtd. by PCR amplification (36 clones in total). The NANBH HC-J6 genome was found to contrain an open reading frame encoding a polypeptide precursor of 3033 amino acid residues. See also AAQ38172-221. (Updated on 25-MAR-2003 to correct PN field.) The sequences AAT27937-T27989 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-c), 5a and 6a. They esp. from the novel subtypes la-c, 2a-d, 3a-f, 4a-c), 5a and 6a. They esp. from the novel subtypes la-c, 2a-d, 3a-f, 4a-c) and 6a. They sep. from the novel subtypes la-c, 2a-d, 3a-f, 4a-c) determined region (UR), the Core/E1, NS4 or NS5B regions of the genome. This sequence represents nucleotides 478-833 from the HCV type 2i isolate BNL6. The new HCV types were isolated from patients with chronic HCV from the Benelux countries, France, Camerron and Vietnam, because of their aberrant reactivities. The RNA was extracted, CDNA synthesised and PCR amplified, cloned and genotyped. The 5'W, Core/E1 and NS5B regions were sequenced either directly or partially and used to classify the new viruses into (sub) types based on comparison with known sequences. The sequences were used to generate the peptides AAR96424-R96524. The sequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used to detect anti-HCV antibodies, for HCV typing or to prevent HCV infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigen; structural; non-structural; non A non B hepatitis virus; NANBHV; NANBH; patient; plasma; diagnosis; detection; carrier; 88.
used to develop probes and primers for new sub:types and vaccines to prevent and treat infection.

non-B hepatitis virus.
```

```
The sequences given in AAGS8814-27 encode antigens of structural and non-structural regions of non A non B hepatitis virus (NANBHV). These sequences were derived from the plasma of a NANBH patient by recombinant DNA techniques. These fragments are useful for the diagnosis of NANBH patients and the detection of NANBHV carriers. (Updated on 27-AUG-2003 to correct OS field.)
                                     Nucleic acid fragment coding non-A non-B hepatitis virus antigen - useful in diagnosis of NANB patient and detection of virus carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid fragment which codes for non-A-non-B type hepatitis virus antigen, useful for diagnosing hepatitis C virus infection in a
